SCHOOL OF COMPUTER SCIENCE AND ARTIFICIAL INTELLIGENCE	DEPARTMENT OF COMPUTER SCIENCE ENGINEERING

Program Name: B. Tech	Assignment Type: Lab	Academic Year:2025-2026

Course Coordinator Name	Dr. Rishabh Mittal
Instructor(s) Name	Mr. S Naresh Kumar Ms. B. Swathi Dr. Sasanko Shekhar Gantayat Mr. Md Sallauddin Dr. Mathivanan Mr. Y Srikanth Ms. N Shilpa Dr. Rishabh Mittal (Coordinator) Dr. R. Prashant Kumar Mr. Ankushavali MD Mr. B Viswanath Ms. Sujitha Reddy Ms. A. Anitha Ms. M.Madhuri Ms. Katherashala Swetha Ms. Velpula sumalatha Mr. Bingi Raju

CourseCode	23CS002PC304	**Course Title**	AI Assisted Coding
Year/Sem	III/II	**Regulation**	R23
Date and Day of Assignment	**Week9 – Monday**	**Time(s)**	23CSBTB01 To 23CSBTB52
Holl.NO:	2303A54050	**Batche:**	47_B

Assignment Number: 18.1(Present assignment number)/**24**(Total number of assignments)

Q.No.	Question	*Expected Time to complete*
1	Lab 18 – API Integration: Connecting to External Services with Error Handling	Week9 - Monday

	Lab Objectives: • Learn how to integrate Python programs with external REST APIs. • Understand API request/response handling using requests or similar libraries. • Implement proper error handling for failed API calls (timeouts, invalid responses, rate limits). • Practice extracting and displaying meaningful information from API responses.	
	Task 1 – Weather API Integration Connect to a Weather API to fetch current weather details for a given city. Instructions: • Prompt AI to generate Python code using the requests library. • Handle errors: invalid city name, API key errors, and network failures. • Display temperature, humidity, and weather description in a readable format. Expected Output: • A working Python script that fetches and displays weather data with proper error handling.	

ai_ass.18.1.py > task.01.py > ...

```python
import requests

# ============================
# CONFIGURATION
# ============================
API_KEY = "YOUR_API_KEY_HERE"   # Replace with your API key
BASE_URL = "https://api.openweathermap.org/data/2.5/weather"

def get_weather(city):
    """Fetch weather data for a given city"""

    params = {
        "q": city,
        "appid": API_KEY,
        "units": "metric"   # Celsius
    }

    try:
        # Send request
        response = requests.get(BASE_URL, params=params, timeout=10)

        # Check HTTP errors
        response.raise_for_status()

        data = response.json()

        # Handle API errors
        if data.get("cod") != 200:
            print(f"❌ Error: {data.get('message', 'Unknown error')}")
            return

        # Extract required information
        temperature = data["main"]["temp"]
        humidity = data["main"]["humidity"]
        description = data["weather"][0]["description"].title()

        # Display results
        print("\n🌤 Weather Report")
        print("----------------------------")
        print(f"City        : {city}")
        print(f"Temperature : {temperature}°C")
        print(f"Humidity    : {humidity}%")
        print(f"Condition   : {description}")
        print("----------------------------")

    except requests.exceptions.HTTPError:
        print("❌ Invalid city name or API issue.")

    except requests.exceptions.ConnectionError:
        print("❌ Network error. Check your internet connection.")

    except requests.exceptions.Timeout:
        print("❌ Request timed out.")
```

```

Task 2 – Currency Exchange Rates

Integrate a Currency Exchange API to convert INR to USD, EUR, and GBP.

Instructions:

- Use AI to generate API request code.
- Validate user input for amount and currency codes.
- Implement error handling for invalid responses and API downtime.
- Show conversion results clearly in tabular format.

Expected Output:

- A script that converts INR to multiple currencies with graceful error handling.

Task 3 – GitHub Repository Info Fetcher

Connect to the GitHub API to fetch details of a repository (e.g., stars,

forks, issues).

Instructions:

- Prompt AI to write a Python function to send GET requests to GitHub API.
- Handle rate limit errors, 404 (repo not found), and invalid input.
- Display repository name, description, stars, forks, and open issues.

Expected Output:

- A Python program that retrieves and displays GitHub repository information with robust error handling.

ai_ass.16.1.py > ❖ task.03.py > ...

Task 4 – Real-Time Application: News Headlines Aggregator

Scenario: Build a News Aggregator using a free News API.

Requirements:

- Fetch top 5 headlines for a given category (sports, technology, health).
- Handle errors like invalid category, missing API key, and request failures.
- Display headlines in a user-friendly numbered list format.
- Include a retry mechanism if the first request fails.

Expected Output:

- A working Python script that retrieves and displays news headlines with proper error handling
